

Research Assignment 1

① Database is a central place where data is store. It is a place where information is store, databases also helps to organise, retrieve the information efficiently.

eg. when customers orders food at chicken lickin the information get stored in database, its taken in from the DMS through to the database (learned in class)

② Data warehouse is a specialised repository that stores large volumes of historical data coming from different sources within an organisation.

- It is different from a normal database because it stores large amount of historical data from multiple sources and a Database a Real-time transactions - it focus on making sure there is no duplicate and or inconsistencies.

Business or companies use a data warehouse because it enables businesses to gain insights and make informed decisions / Business decisions
(Kipngetich Emmanuel)

③

③ A data lake is a big and flexible storage repository that holds raw data in its original format until it is needed. It is different from a database because the data in a database are already formatted.
