

③ Amazon Aurora - is a cloud-native relational compatible with MySQL and PostgreSQL

④ Google Cloudspanner - is a scalable, globally distributed relational database service.

⑨ ETL - it is a core data integration process used to gather data from multiple fragmented sources, clean and convert it into a usable format, and store it in a central repository e.g Database/Data-warehouse (AWS)

⑩ Extract → is the process of pulling data from various sources.

⑪ Transform → the extracted raw data goes under a series of rules and processes to make it reliable and uniform. (cleaning and enriching)

⑫ Load → The refined data is transformed and written into a central system (e.g Database)

⑬ CSV → is a simple text format for tabular data. (e.g spreadsheets)

* Parquet → A highly efficient columnar storage format (e.g snowflake)

* JSON → A flexible, text-based format for nested data (e.g Javascript)
