

* AI - is an umbrella while ML - is a specialised subset within AI and Deep Learning is an even more specialised subset of machine learning. (IBM)

(14) Natural language processing is a branch of artificial intelligence that empowers computers to understand, interpret and generate human language.

Three Real world Applications

- ① Digital voice assistants (Apple Siri)
- ② Email spam filter (Gmail)
- ③ Machine translation (eg Google translate) (IBM)

(15) Large Language model is an advanced AI system trained on massive amounts of text to understand, summarise and generate human-like language.

- Standard machine learning and LLM are both under the umbrella of AI but their scope differ.

* Standard ML models are designed for narrow tasks (eg detecting spam)

* LLM - its purpose is to perform thousands of distinct tasks. eg coding, translation (IBM)
