

(18) Computer vision is a field of artificial intelligence that trains machines to interpret and understand the visual world.

⇒ Machines process visual information using mathematics and data.

Two Real-world use of computer vision.

① Autonomous vehicle → self-driving cars rely on computer vision to understand their surroundings in real-time.

② Medical image diagnostic → (in healthcare) computer vision analyzes medical scans like X-rays, MRIs and CT scans. (IBM)

(19) (API) Application programming interface is a set of rules and protocols that allow different software applications to communicate and share data with each other.

→ The API is like a waiter in a Restaurant

* A client sitting at a table with a menu of choice. Client wants a meat but they cannot go to the kitchen themselves. Then there is a kitchen where all ingredients and expertise but it does not interact with customers, and then the waiter is the intermediary, you give order
