②4 A map function is a higher-order function" that transforms every item in a collection by applying a specific operation to each one.

— In programming and data processing, it is primarily used to perform uniform, element-wise transformation without writing manual loops

eg Javascript

```
// A List of numbers  
const numbers = [1, 2, 3, 4];
```

```
// Using the javascript Array [map() method]  
(https://developer.mozilla.org/en-us,  
const squared = numbers.map(num => num *  
num);  
console.log(squared); // output: [1, 4, 9, 16]  
(www.geeksforgeeks.org)
```
