

(25) Cloud computing is the delivery of computing services - including servers, storage, database, networking and software

* Three cloud service models:

① Infrastructure as a service (IaaS)

- It provides fundamental computing like virtual servers, network connections, and data storage. e.g. AWS

② Platform as a service (PaaS) → Delivers a framework and environment for developers to build, test, and deploy applications. e.g. (Google App Engine → Google cloud)

③ Software as a Service (SaaS) → Delivers fully developed, ready to use software applications over the internet on a subscription basis e.g. Microsoft 365

(26) A version control system (VCS) → is a tool that tracks the history of changes made to files over time

→ GIT is a free, open-source distributed version control system.
