

③ Matplotlib → A comprehensive library for creating static, animated, and interactive visualisations. It is the standard tool for generating plots, charts, and graphs to communicate data insights effectively.

④ Scikit-Learn → The go-to library for traditional machine learning. It offers simple and efficient tools for data mining and predictive modeling, including algorithms for classification, regression and clustering.

② Data privacy is the principle that individuals have over their personal information

— it defines who has access to personal e.g. your email, biometrics, financial records and medical history. It gives you power to decide if, how and to whom this information is shared.

* Data privacy is important because of the following points

① Prevents misuse — prevents you from identity theft, financial fraud and unauthorized tracking

② Maintains Autonomy → It ensures that your personal life isn't monitored or exploited for corporate or governmental gain.
